Beyond the Blockbuster: The Start of a Multi-Franchise Immunology Leader

Key Take-away: The most recent earnings call (Q1 2026, May 7th) showed no signs of the Argenx growth story slowing down. Product net sales have hit \$1.3B, representing 63% year-over-year growth, and management called it “argenx’s 17th consecutive quarter of VYVGART growth.” Operating profit nearly tripled YoY to \$394M, and the company currently sits on \$4.9B in cash, with no outstanding debt.

Looking to the future, quick approvals of drugs to expand the company’s drug pipeline. On May 8th, 2026 the FDA approved a label expansion, which made VYVGART and VYVGART Hytrulo the first approved treatments for all serotypes of adult patients with gMG, including anti-AChR, anti-MuSK, anti-LRP4, and triple seronegative patients. Then, on June 3rd, Argenx presented new data at EULAR 2026, proving that efgartigimod provides meaningful improvements in patients with myositis and Sjogren’s disease.

Overall, the industry wide trend lies in the pivot from broad immunosuppression towards anti-body engineered therapies such as the FcRn blockade and complement inhibition. Like its FcRn inhibitor category, the company is repeating its success with empasiprubart as a complement system inhibitor. Though a narrower addressable population as compared to mass-market chronic disease drugs, these orphan autoimmune diseases come less competition, provide sticky revenue, and forge prescriber relationships once a drug becomes “the standard” for specific indications.

VYVGART turns into the default MG drug: The recent seronegative gMG approval aids in 2 main things. Firstly, as VYVGART is approved to target various different antibodies, prescribers begin to turn it to it as the default for most patients. Secondly, as per Argenx’s TAM bridge, this approval adds about 11K US patients toward their 60K by 2030 goal. Another 7K will be added upon the ocular MG submission and approval. VYVGART now has the potential of becoming the first and only approved therapy across the entire MG market, which furthers the company’s image as innovative rather than just a one-time increase in sales.

Leadership transition occurs in the strong quarter in history: As of Q1 2026, Karen Massey is confirmed to be the CEO as Tim Van Hauwermeriren moves down to Non-Executive Chairperson. This succession lands at the end of the company’s strongest growing quarter, setting it up for future success. Rather than inheriting a company in need of stabilization or turnover, Karen Massey can turn her focus to sustainability, growth, and scalability on a global scale. With the broadest label approval to date, the company’s vision of “continuous pipeline innovation” upholds itself.

The beginnings of the next growth engine: Future growth is lined up for the next 2 quarters of 2026. Empasiprubart MMN (Multifocal Motor Neuropathy) registrational readout is due Q4 2026, ALKIVIA myositis topline is due Q3 2026, and ADVANCE-NEXT topline is also due Q4 2026. These three potential values creating readouts all

scheduled for under 6 months indicates steady future growth and expansion as Argenx moves to dominate the immunology field.

Valuation: We initiate coverage with a \$1,092.00 PT and an **Overweight** rating.

Company Overview

Company Description: Argenx is a commercial-stage global biopharmaceutical company that focuses on discovering and developing drugs for autoimmune diseases. The company uses its proprietary antibody discovery platform, SIMPLE ANTIBODY, to aid in drug discovery and research. Following the commercial launch of its main product VYVGART, Argenx has transformed from a clinical-stage company to a profitable and growing commercial business. Thus far, revenue is primarily generated through sales of the FcRn inhibitor franchise, which has indications for gMG and CIDP worldwide, and for ITP in Japan. Beyond its commercial line, the company maintains a diverse pipeline of drugs spanning fields on neurology, rheumatology, nephrology, hematology, and endocrinology, which furthers its long-term growth potential.

Commercial Franchise: VYVGART serves as Argenx's primary revenue driver and commercial asset. It serves as a FcRn antibody inhibitor to reduce pathogenic IgG antibodies responsible for a variety of autoimmune diseases. The Argenx franchise includes intravenous, subcutaneous, and pre-filled syringes to capture most of the addressable market. The company aims to maximize the value of this franchise by expanding into more indications to serve additional patients worldwide.

Favorable Financial Positioning: Different from other biotechnology companies, Argenx generates positive operating cash flow while maintaining a nearly debt-free balance sheet, with \$4.9B in cash and current financial assets. This financial positioning is favorable to growing companies, due to flexibility for internal drug development while also supporting commercialization and research across multiple drug platforms. The combination of a profitable franchise and a robust development pipeline backed by strong finances differentiates Argenx from its competitors and positions it for future growth.

Industry Overview

Increased Investment in Immunology Innovation: The industry-wide focus has gradually moved towards Immunology, which has become one of the fastest-growing therapeutic areas for pharmaceutical investment. Large companies are increasingly acquiring and partnering with biotechnology firms to strengthen their own immunology pipelines prior to upcoming patent expirations. This pivot is primarily due to the Inflation Reduction Act (IRA), which penalizes small molecule drugs by subjecting them to price cuts years earlier than complex biologics. As a result, companies are offsetting their risk by moving towards large-molecule immunology drugs with autoimmune indications.

Shift towards Precision Immunology: The overall move from broad immunosuppressants like steroids, IVIg, and corticosteroids is attributed to their severe off-target toxicity, high infection risks, and long-term adverse effects. Instead, current pharmaceutical companies prioritize targeted biologics designed to selectively regulate certain immune pathways. Examples include complement cascade blockers and B-cell depleting therapies. By isolating and targeting specific pathogenic antibodies without inducing systematic immune suppression, these therapies maximize efficiency and prioritize patient safety.

Adoption of At-Home Therapies: The broader healthcare industry has also seen a major shift away from traditional, hospital-centric care and toward decentralized, patient-centric delivery. This is driven by economic pressure to reduce medical infrastructure overhead as well as a consumer demand for more accessible medicine and home-based therapy. This macro shift is supported by regulations that allow for online prescription sales and self-injectable and oral formulas. Overall, this shift favors companies that are able to streamline drug delivery adjunct to customer preferences.

Investment Theses

More than a label expansion: As of 2026, the seronegative approval for VYVGART adds more than just 11K patients. It affects the way prescribers choose drugs for patients of various diseases. Because neurologists tend to default prescribing the medication that offers the least risk by antibody status, VYVGART now becomes the trustworthy default. Given that 4/5 US prescribers already preferred VYVGART for gMG prior to the seronegative approval, and 68% of PFS patients (self-injecting) are new the Argenx franchise, the label expansion will do more than simply add a fixed number of patients. Instead, it will reinforce VYVGART's position as the first-choice treatment across the MG market.

Beyond VYVGART-Multiple paths to growth: Heading into 2026-2027, a debt-free balance sheet with \$4.9B in cash puts Argenx in a position where it can fully fund empasiprubarb (for MMN/CDIP), the myositis/SjD rheumatology indications, ARGX-213, ARGX 121, and adimanebart without the need of capital raising. Such a balance sheet and these upcoming catalysts point towards positive outcomes for these new indications. These developments ultimately prove that Argenx's long term value extends far beyond just VYVGART and progresses towards an entire immunology franchise.

Price Target & Valuation

Our analysis gives (\$ARGX) a price target of \$1,092.00 and an overweight rating.

Potential Downsides to Our Rating

Competitive Risk: Due to the increased need for immunology research and drug development, Argenx runs its operations in a highly competitive market. Its competitors include established pharmaceutical giants, emerging biotechnology companies, and other small-molecule developing firms. Though VYVGART currently is a first-in-market within the FcRn inhibitor class, other competitors have advanced their own therapies for gMG, CIDP, and other autoimmune diseases.

Clinical Risk: Though much of Argenx’s short-term revenue is tied to commercial drugs, the majority of its long-term growth and revenue is contingent upon successful clinical trials and drug discovery. Delays in these trials, unfavorable results, and regulatory setbacks are potential outcomes that can postpone product approvals and delay commercialization efforts. However, the company remains proactive in realizing such setbacks and continues to have a wide range of drugs in their development pipeline to offset any potential failures.

Pricing Risk: Given that Argenx is a manufacturer of high-cost biologic therapies, it is subject to government pricing and reimbursement programs which would directly affect the prices it can charge and the payments received. Healthcare reforms like Medicare price negotiations, Medicaid rebate programs, and other price cuts under the IRA would negatively impact revenue growth.

Our Price Target: **\$1,092.00**
Our PT is contingent upon Argenx sustaining their commercial dominance within the gMG, CIDP, and ITP space while continuing to capture majority of the market. With Karen Massey taking over, the company will continue to thrive under her leadership and execute the company’s core vision and 2030 plan.

Our Upside Case: **\$1,362.00**
Our upside case is based on the “best case” timeline, where Argenx successfully scales beyond its current franchise. Its pipeline candidates achieve regulatory approvals, and the company can globally scale its medicine to patients with rare autoimmune diseases.

Our Downside Case: **\$907.00**
Our downside case is based upon Argenx’s strong competitors such as Nuerocrine, J&J, and UCB, that may advance their alternative FcRn inhibitors. These options could lead to erosion of Argenx’s market share and slower than expected growth.

About \$ARGX

Argenx (\$ARGX), founded in 2008 operates as a global immunology biopharmaceutical company. It is headquartered in the Netherlands and focuses on researching and developing anti-body based medicines for severe autoimmune diseases. Currently treating 19,000 patients worldwide, Argenx has its sights set on reaching 50,000 patients as a growing biopharmaceutical company. Its primary goal is to chart a new course in immunology through innovation, co-creation, empowerment, excellence, and humility.
